

Import and export capabilities

Integration allows the user to seamlessly access information coming from multiple sources or to manage it for other systems, including enterprise systems or websites.

Importing and Exporting

Integration is most straightforward using the data import and export capabilities within AgilityCMS®. Data formats can be delimited text, RTF or XML, which can be run on an automated basis. XML exports can trigger XSL transformations to meet any data format requirements.

Content Gateway

The Content Gateway module provides the capability of having real time direct hooks into other systems, enabling content to be viewed, edited and published simultaneously with no wait for any import and export mechanism.

Software Development Kit

The Software Development Kit (SDK) allows access to the Java Application Programming Interface (API) of AgilityCMS®. The SDK allows extensions to be made to the software so that it can incorporate any business logic and opens beyond data integration to real software integration.

By setting up adapted integration mechanisms, the user is guaranteed easy and direct access to the necessary information regardless of the original source, and with 100% confidence in its accuracy.

Features and Benefits

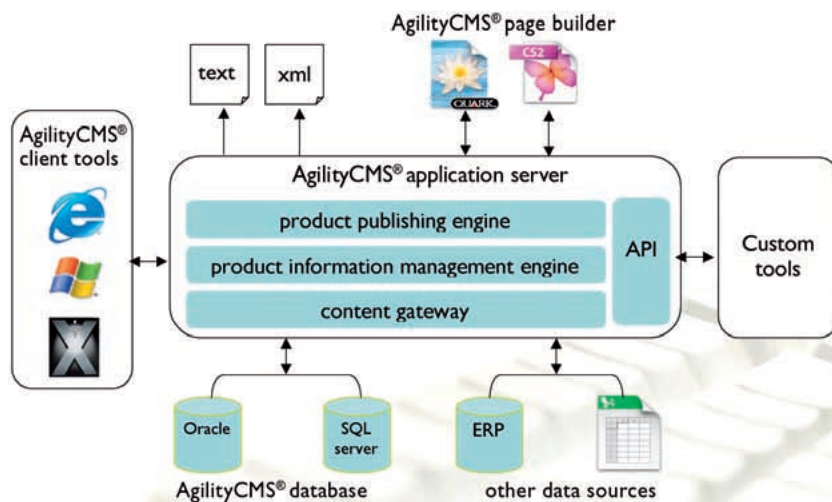

- Seamless access to multiple information sources
- Company-wide information system coherence enhancement
- Eliminates re-keying or manual copy
- Supports enterprise-wide master data management

BASIC SYSTEM REQUIREMENTS

AgilityCMS®

Access to other corporate information sources

Content Gateway or SDK options
